

## AirBlock® Wireless Security Software

### What is AirBlock?

AirBlock is a software-only product which protects against theft of important data and unauthorized access to the wireless network. The software is simple to install and works in the background completely transparent to the user.

### Is AirBlock the right solution for me?

If you have a wireless broadband internet connection and want to protect your computer and its data from potential intruders, and want to increase performance by stopping unauthorized use of your Internet connection – then AirBlock is for you. Remember, even you have anti-virus, anti-spam and a personal firewall, you are not protected from wireless attacks.

### From what dangers does AirBlock protect me?

Microsoft's® Windows XP automatically shows available wireless networks and allows anyone to connect to any wireless network with a single click. This means anyone with a wireless laptop can easily access your Internet connection. There are also downloadable applications from the Internet which enable interception of wireless data from any wireless laptop.

Whether on purpose, or by accident, your neighbors can also connect to your wireless broadband modem and start degrading performance by using your valuable bandwidth for downloading their favorite music and videos.

Unprotected wireless connections have also been used as entry points for illegal activity which can eventually be traced back to your computer! Not to mention “airborne” viruses and Trojan Horses which can easily be injected into your computer via the airwaves.

### How does AirBlock work?

AirBlock implements in an automated fashion, all the necessary configuration parameters of both wireless cards and routers, using industry approved encryption and authentication to protect both your data and your network. The software can also be used for automatically changing encryption keys on a regular basis, thereby providing a higher level of security than is currently supported by the majority of wireless equipment.

The AirBlock software must be installed on every machine in the wireless network. First time installation requires a user-defined Passcode which is used to allow only authorized users access to the wireless network. After the initial installation, AirBlock operates in background mode completely transparent to the user.

### Are there limitations for using AirBlock?

Yes. AirBlock can only be used on Windows 2000/XP machines in single access point configurations, using wireless equipment which appears on the AirBlock List of Supported Wireless Routers.
