

# AIR STOP™

**WIRELESS &  
PROTECTED**

## Protection against leakage of corporate information

AirStop is for IT professionals managing laptop computers with multiple communications adapters and storage devices, who must control connectivity in order to ensure network security. The software-only product is designed as an enterprise class solution for organizations with or without multiple data networks.

Simultaneous connection to two networks is also referred to as “bridging”. In this scenario potential intruders can use any computer logged into the network as a bridge to mission-critical servers and confidential information.

In the past, intruders had to gain physical access to a networked computer in order to create a bridge to the network. But today, any computer with a standard WiFi, Bluetooth or cellular adapter is an easy target for unauthorized wireless bridging.

In addition, fixed and removable storage devices such as USB flash memory sticks and writeable CD/DVD drives constitute another potential data leak which must be protected.

## Full endpoint security in a simple automated software package

AirStop prevents simultaneous operation of communications adapters thereby eliminating the possibility of unauthorized bridging. It also protects against leaks to USB storage devices and disk drives. The software gives IT departments the ability to define and enforce endpoint security policy and cannot be disabled by endusers.

### Features

- ◆ **Automated**  
Senses primary communications adapter and disables others
- ◆ **Secure**  
Prevents simultaneous operation of multiple adapters
- ◆ **Transparent**  
Background operation is transparent to endusers
- ◆ **Configurable**  
Administrator defined dynamic security policy enforcement
- ◆ **Protected**  
Endusers can not remove or reconfigure the software

## Configuration

### Client

The administrator configures the AirStop Client by prioritizing the available communications adapters and storage devices on a typical machine. Once the security policy is finalized, the software can be distributed using Microsoft SMS or installed as part of the login process. AirStop is password protected and cannot be changed or removed even by users with local administrative rights.

### Server

The AirStop Server is an optional software package which collects data from all AirStop clients. The web based solution provides administrators with up to the minute information regarding adapter usage across the enterprise or historical data on specific adapters over time. All information can be viewed using a standard browser.

Order	Device Name
1	IBM Integrated 56K Modem
2	Intel(R) PRO/1000 MT Mobile
3	Intel(R) PRO/Wireless LAN 21
4	Bluetooth Device (Personal Ar
5	1394 Net Adapter

## About Code Red

Headquartered in Jerusalem, Israel, Code Red Systems was established to simplify the management and security of wireless devices produced by multiple vendors in business, industrial and residential computing environments. The company's solutions are hardware independent, thereby preserving the interoperability of the 802.11 standard. The underlying architecture is modular and flexible in order to accommodate emerging multiple wireless protocols, applications and security standards.
