

AirStop® - Wireless Endpoint Security

Prevent random wireless connections

Random wireless connections can be your neighbor's network, the coffee shop next door, or the city-wide free WiFi project. Even if resources have been invested in securing your wireless network, laptops in your organization may be randomly connecting insecure external networks.

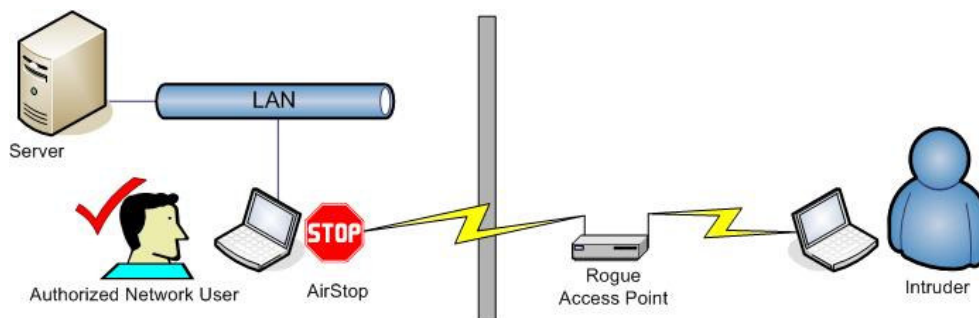

AirStop disconnects users from unauthorized external wireless network and forces them to use authorized secure internal networks only.

Prevent wireless bridging

The term "bridging" refers to a computer which acts as a "bridge" between two data communications networks. Potentially, any computer with both a wired and wireless Ethernet adapter can easily be transformed into a network bridge.

AirStop disables communications adapters and storage devices to prevent bridging between wired and wireless networks.

Enforce wireless security policy

The software only solution consists of client software which works with or without a network connection. The optional server software can be used for management and reporting.

AirStop is an enterprise grade solution with centralized installation and configuration, for controlling communications adapters and storage devices in corporate environments.

Download a 30-day free trial

Companies interested in trying the AirStop software should visit download.com or contact their local distributor for a free trial.
